

# ADVICE PARASITES

## 1 Explain preventive care

Pet owners can protect their pet using the best antiparasitic treatments. Ticks can be active at low temperatures and can transmit serious diseases to pets. A year-round solution is needed.

## 2 Emphasise hygiene and cleanliness

Some owners may not be aware that faeces can carry parasites. Highlight the importance of hygiene as a complimentary preventive measure.

## 3 Keep the grass short

Owners can reduce the risk of ticks surviving in their gardens if they keep the grass short, and by treating their pets. Also, remind dog and cat owners to check their pet for ticks after every walk in the park.
